REGIONAL MUNICIPALITY OF NIAGARA SOUTH NIAGARA FALLS WASTEWATER SOLUTIONS

# V3.9 – Geotechnical Investigations

Niagara Region is committed to reviewing its practices, processes and the built environment for barriers to access for persons with disabilities. If you require additional or other formats for communicating the details of the appendices in this attached report, please contact the project team <u>new.treatment.plant@niagararegion.ca</u>

## LIST OF APPENDICES

#### Appendix V3.1 Natural Environment

- V3.1.1 Natural Environment Baseline Report
- V3.1.2 Natural Environment Assessment Report

#### Appendix V3.2 Archaeological Assessments

- V3.2.1 Stage I AA Long List of WWTP Sites
- V3.2.2 Stage I AA (Marine) Preferred Outfall Location
- V3.2.3 Stage I & 2 AA Preferred WWTP Site
- V3.2.4 Stage I AA Preferred Trunk Sewer
- V3.2.5 Stage I AA Preferred Thorold South Servicing Strategy
- V3.2.6 Stage 2 AA Preferred Black Horse SPS Site (Thorold South)

#### Appendix V3.3 Cultural Heritage Assessments

- V3.3.1 Cultural Heritage Screening Report Study Area
- V3.3.2 Cultural Heritage Assessment Report Preferred WWTP Site
- V3.3.3 Cultural Heritage Evaluation Report Preferred WWTP Site
- V3.3.4 Cultural Heritage Assessment Report Preferred Trunk Sewer
- V3.3.5 Cultural Heritage Assessment Report Preferred Thorold South Servicing Strategy

#### Appendix V3.4 Contamination Review

- V3.4.1 ERIS Contamination Screening Short Listed WWTP Sites
- V3.4.2 ERIS Contamination Screening Preferred WWTP Site
- V3.4.3 Phase I Environmental Site Assessment Preferred WWTP Site
- V3.4.4 Phase II Environmental Site Assessment Preferred WWTP Site
- V3.4.5 Phase I Environmental Site Assessment Preferred Trunk Sewer
- V3.4.6 Phase II Environmental Site Assessment Preferred Trunk Sewer

#### Appendix V3.5 Assimilative Capacity Studies

- V3.5.1 ACS Modelling Approach
- V3.5.2 ACS Screening
- V3.5.3 ACS Detailed Assessment

#### Appendix V3.6 Air, Odour, and Noise Assessments

- V3.6.1 Air and Odour Impact Assessment Preferred WWTP Site
- V3.6.2 Odour Control Technology Preferred WWTP Site
- V3.6.3 Noise Impact Assessment Preferred WWTP Site

#### Appendix V3.7 Planning

- V3.7.1 Growth and Flow Projections
- V3.7.2 Wet Weather Flow Management
- V3.7.3 Grassy Brook Service Area Review
- Appendix V3.8 Agricultural Screening
  - V3.8.1 Agricultural Screening Report Short Listed WWTP Sites
- **Appendix V3.9 Geotechnical Investigations** 
  - V3.9.1 Geotechnical Baseline Study Area
  - V3.9.2 Preliminary Geotechnical Investigations Preferred WWTP Site & Trunk Sewer
- Appendix V3.10 Hydrogeological Investigations
  - V3.10.1 Hydrogeological Baseline Study Area
  - V3.10.2 Preliminary Hydrogeological Investigations Preferred WWTP Site & Trunk Sewer

#### Appendix V3.11 WWTP Design Basis

- V3.11.1 Design Basis New WWTP
- V3.11.2 Technology Review New WWTP

# 1.0 INTRODUCTION

Golder Associates Ltd. (Golder) has been retained by GM BluePlan Engineering Ltd. (GMBP) to prepare a geotechnical desktop study report in support of the South Niagara Falls Wastewater Solutions Schedule 'C' Municipal Class Environmental Assessment (EA) Project (the Project).

This report was prepared for the exclusive use of GMBP and The Regional Municipality of Niagara (the Region) and is only intended to be used for planning and early stage design purposes as well as recommendations for aspects of future geotechnical investigations. Any use that a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of the third party. The report is based solely on the review of historical and publicly available information and data obtained by Golder and/or provided by GMBP/the Region as described in this report. Additional explorations of subsurface conditions will need to be carried out to better define the local geologic stratigraphy, groundwater levels, and the engineering properties of the subsurface materials for any further design activities.

The factual data, conceptual interpretations, considerations, and recommendations contained in this report pertain to a specific project as described in the report and are not applicable to any other project or site location. In addition, this report should be read in conjunction with the "Important Information and Limitations of This Report" contained following the text of this report. The reader's attention is specifically drawn to this information, as it is essential for the proper use and interpretation of this report.

# 2.0 PROJECT AND SITE DESCRIPTION

The Region recently completed their 2041 Growth Plan, which identified significant growth in residents and employment within the Municipality by 2041. In 2017, the Region updated their Water and Wastewater Master Servicing Plan Update (MSP), which evaluated the ability of existing and planned water and wastewater infrastructure to efficiently and effectively service the Region's existing users, service anticipated growth and evaluate and develop recommended strategies. The Region is to select a new Wastewater Treatment Plant (WWTP) within South Niagara Falls as the preferred South Niagara Falls servicing strategy to service the anticipated growth for Niagara Region. It is currently anticipated that the proposed new WWTP would be located on one of the Sites of Interest while associated infrastructure upgrades may take place within the wider Regional Study Area.

A key map of the Regional Study Area is shown on Figure 1. The approximate eastern and western extents of Regional Study Area reach from the Welland Canal area to the Niagara River, and extends to Church's Lane to the north and to Marshall Road in the south.

The Sites of Interest are located in the southern part of the Regional Study Area as shown on Figure 2. There are ten Sites of Interest (Sites 1 to 10), encompassing numerous lots and concessions for a total area of approximately 400.8 hectare (ha). Sites of Interest occupy the following lots and concessions:

Sites 1, 3 to 7, and 9 occupy portions or the entirety of Lots 187, 197, 205, and 209-216, Geographic Township of Stamford, former County of Welland, now the City of Niagara Falls, Regional Municipality of Niagara.

- Sites 8 and 10 occupy portions of Lots 5-8, Broken Front on Chippawa Creek, Geographic Township of Willoughby, former County of Welland, now the City of Niagara Falls, Regional Municipality of Niagara.
- Site 2 occupies portions of Lot 5-6, Broken Front Concession, Geographic Township of Crowland, former County of Welland, now the City of Niagara Falls, Regional Municipality of Niagara.

The land use in the Sites of Interest is primarily agricultural with some industrial or residential developments throughout the Regional Study Area.

# 3.0 SOURCES OF INFORMATION

Databases of publicly available documents which were not subjected to non-disclosure agreements (NDAs) or containing any sensitive environmental (contamination) issues were reviewed in development of this desktop study. Water well records provided by the Ministry of the Environment, Conservation and Parks (MECP) and boreholes from the Ministry of Transportation of Ontario (MTO) database were used for this study. MTO boreholes are generally available along the Queen Elizabeth Way (QEW) and in some cases are far from the proposed alignment. Near the Welland Canal, available boreholes are about 50 m away from the proposed alignment. Where available, the overburden information from the MECP boreholes could not be relied upon since the MECP water wells were drilled primarily for measuring groundwater levels and the information related to the geotechnical conditions were not included during drilling.

The following documents, provided to Golder by GMBP, were also reviewed in preparation of this desktop geotechnical study report.

- Palmer Environmental Consulting Group Inc., "Geotechnical Memo in support of the Environmental Assessment Amendment – Niagara Falls WTP Water Intake, Niagara Falls, Ontario", dated, July 8, 2011.
- Trow Associates Inc., "Preliminary Geotechnical Investigation Niagara Falls Water Treatment Plant, Intake Relocation, City of Niagara Falls, Ontario", dated, August 8, 2007.

# 4.0 SITE GEOLOGY AND SUBSURFACE CONDITIONS

# 4.1 Regional Geology

The Regional Study Area is generally located within the Haldimand Clay Plain physiographic region with the northwest corner of the Regional Study Area extending to the Niagara Escarpment physiographic region to Lake Erie, as delineated in The Physiography of Southern Ontario (Chapman and Putnam 1984).

The Haldimand Clay Plain was submerged by glacial Lake Warren and much of it is covered by lacustrine clay deposits. The general topography of this region is generally flat, gentle sloping landscape dominated by clayey soils. At its highest ground where the Haldimand Clay Plain meets the Niagara Escarpment, recessional moraines were built by ice globe that occupies the Lake Ontario basin. Aside from the gravel hills of Fonthill, the moraines

consist of heavy boulder clay and have a much-subdued relief due to having been formed under water (Chapman and Putnam 1984). These clayey soils are presented by the fine-textured glaciolacustrine deposits that are mapped across the majority of the Haldimand Clay physiographic region. Coarser-textured soils were mapped beneath the central part of the Niagara Falls built up area while minor areas of alluvial deposits were mapped along the Region's creeks and rivers. The surficial geology mapping shows several areas of man-made deposits within the physiographic region as shown on Figure 3. These are interpreted to be areas of fill soils resulting from large scale construction works and industrial sites. Fill soils should also be expected near roadways. Most of the Sites of Interest are underlain by the fine-textured glaciolacustrine deposits with smaller area of alluvial deposits along the Welland River/Chippawa Creek.

The Niagara peninsula of the Niagara Escarpment consists of Palaeozoic sedimentary strata bedrock of the Silurian and Devonian age. The bed dips to the south under Lake Erie with a shallow inclination of approximately 5.7 m/km. The massive dolomitic limestone is from the Salina Formation within the Welland area and Salina Formation contains siltstone and calcareous shaly interbeds with occasional limestone layers and inclusions of gypsum within the dolomite. The lower Welland River subwatershed are predominantly underlain with bedrock from the middle to upper Silurian period; Eramosa Formation (dolostone), Guelph Formation (dolostone), and the Salina Formation (dolostone, shale and gypsum) as described in the Urban Geology of Canadian Cities (Menzies and Taylor 1984). These bedrock units are generally oriented horizontally with a slight dip towards the south as shown on Figure 4.

During the middle Silurian period, the tropical sea that covered the Niagara Peninsula deepened and the Guelph formation was deposited. The Guelph formation consists of reef and inter-reef deposits, characterized by tan, sugary, fossiliferous dolostone (Ministry of Northern Development 2011). During the upper Silurian period, the seas become shallower resulting in land surfaces becoming more arid, and deposition of shale and fine grained dolostone occurred. Restricted circulation and increased evaporation of the sea resulted in deposition of evaporites (halite, gypsum, and anhydrite), evaporitic carbonates and shales of the Salina Formation (Ministry of Northern Development 2011).

The bedrock predominately at the Sites of Interest is Guelph formation and Salina Formation composing of dolomite and shale.

# 4.2 Subsurface Conditions

A desktop review of the available subsurface information near the proposed trunk sewer alignment has been carried out, obtained from publicly available sources listed in Section 3.0. The available borehole records are contained in Appendix A. The detailed subsurface soil, bedrock and groundwater conditions encountered in the boreholes and the results of in situ and laboratory test results are provided on the borehole records. The borehole locations are shown on Figures 6 to 10 and projected on a profile line along the proposed trunk sewer alignment. Consideration should be given to the distance between the proposed alignment and WWTP and the borehole locations when interpreting the borehole information.

Based on available borehole information, the subsurface conditions along the proposed sewer alignment beneath any at/near surface layers of topsoil, organics and fill consist of up to about 30 m thick glaciolacustrine cohesive soils overlying a dense to very dense non-cohesive soils comprised of sandy silt to silty sand, with varying amount of gravel. Generally, the glaciolacustrine cohesive deposit has a consistency of very soft to very stiff.

The depth to bedrock (thickness of overburden soils) varies from approximately 12 m to deeper than 30 m along the proposed trunk sewer alignment.

A summary of subsurface conditions encountered in the available boreholes are provided below.

#### 4.2.1 Fill

An approximately 2 m to 10 m thick layer of fill was encountered in boreholes advanced near the Welland Canal. The fill consists of cohesive and non-cohesive layers.

The Standard Penetration Test (SPT) "N"-values measured within the fill layer range from 2 blows to 63 blows per 0.3 m of penetration, suggesting loose to dense state of compactness.

## 4.2.2 Cohesive Layer

An approximately 9 m to 25 m thick layer of cohesive soils comprised of clayey silt to silty clay was encountered below the fill in the boreholes advanced near the Welland Canal. The deposit in places contain non-cohesive pockets of silt to sand.

The SPT "N"-values measured within the cohesive layer range from 1 blow to 26 blows per 0.3 m of penetration, suggesting a very soft to very stiff consistency. In situ shear vane tests were carried out within the cohesive layer and measured undrained shear strengths of 25 kPa to 96 kPa, indicating soft to stiff consistency.

## 4.2.3 Non-cohesive Layer

Below the cohesive layer, boreholes penetrated a layer of non-cohesive soils. The non-cohesive soils grades from silt to sandy silt to silt and sand to silty sand to sand and contain variable amount of gravel. The layer is up to about 10 m thick and overlies the bedrock at this site.

The SPT "N"-values measured within the non-cohesive layer range from 12 blows per 0.3 m of penetration to 100 blows per 0.02 m of penetration, indicating a compact to very dense compactness.

## 4.2.4 Bedrock Conditions

The overburden soils are underlain by bedrock of the Upper Silurian with sedimentary limestone, shale, sandstone, and dolostone.

Bedrock typically consists of completely weathered to fresh, grey, fine to very fine grained, medium strong to very strong limestone and dolomite layers and very weak to medium strong shale of Salina Formation. The bedrock generally transitions with depth from completely weathered at bedrock surface to fresh bedrock. Completely to highly weathered dolostone/residual soil/till and dolostone mixture zone should be expected at the overburden and bedrock interface.

Based on the available information, the depth of bedrock in the vicinity of the proposed sewer alignment generally ranges from 12 m (north) to deeper than 30 m (south) below ground surface. The depths to bedrock as encountered in the existing boreholes are shown on Figures 8 and 9.

It is possible that the upper few meters of bedrock may be more weathered and fractured. Below the more weathered/fractured zone, the bedrock is expected to be of moderately weathered to fresh.

Shale is expected to have strength grades of very weak (R1) to Medium Strong (R3) and limestone/siltstone is expected to have strength grades of Medium Strong (R3) to Very Strong (R5).

## 4.2.5 Groundwater Conditions

Based on the limited available information, the prevalent groundwater level at the Sites of Interest can be assumed to be approximately 1 m to 3 m below ground surface. The MECP water well record locations are provided in Figure 5. The groundwater level should be expected to fluctuate seasonally in response to changes in precipitation and snow melt and is expected to be higher during the spring and periods of precipitation. Perched groundwater conditions are expected within the till soils.

# 5.0 CONCEPTUAL DESIGN CONSIDERATIONS

It is understood that the Region proposes a new WWTP and associated infrastructure within one of the Sites of Interest. At the time of preparing this report, the final location of the WWTP is not confirmed.

# 5.1 Wastewater Treatment Facility Foundations

The details of the proposed wastewater facilities and associated structures are not available at the time of preparing this report. Considering the shallow soil conditions within the Regional Study Area, comprised of soft to stiff cohesive soils, it is expected that settlement sensitive structures would have to be supported on a system of deep foundations. Lightly loaded structures with more tolerance for settlements may be supported on conventional spread footings or deep foundations.

The final foundation types should be selected based on the subsurface conditions at the actual locations, structural loads, and settlement tolerance.

# 5.2 Trunk Sewer System

The conceptual sketches indicate that a trunk sewer system will be installed from Sta 0+00 to Sta 4+554 with the invert of the trunk sewer ranges from about 8 m to 17 m as shown on Figures 6 to 10. It is expected that the trunk sewer will be installed by means of tunnelling (i.e., trenchless method). This section of the report provides conceptual geotechnical recommendations and considerations as part of the Municipal Class EA for the installation of the sewer pipes.

## 5.2.1 Tunnelling Installations

Based on the proposed invert elevations and limited subsurface information, the trenchless installations will likely be excavated mostly through overburden soils with a possibility of installation in bedrock.

The project planning should consider the cost, schedule, space for entry and exit points, and availability of local contractors and equipment. The appropriateness of the trenchless installation methods will depend greatly on the subsurface conditions at the site and size of the installation (diameter and length). A detailed subsurface exploration should be carried out for trenchless installations.

The advantages, disadvantages, and risks/consequences associated with various trenchless construction methods, are compared in Table 1 on the basis of anticipated ground conditions, depth of cover, vertical and horizontal alignment, length of pipe installation, availability of equipment, and levels of risk of successfully completing the installation.

Installation Method	Advantages	Disadvantages	Risk / Consequences
Micro-tunnelling Boring Machine (MTBM) with Slurry	<ul> <li>Slurry-type MTBM is able to counterbalance earth (soil and/or rock) and groundwater pressures in a controlled manner, providing continuous face support and eliminating need for dewatering at the tunnel face along the alignment.</li> <li>Can be steered continuously, providing good control over line and grade.</li> <li>Tunnel is fully lined as excavation progresses (i.e., casing pipe is installed behind the MTBM during forward advancement).</li> <li>No personnel entry is required.</li> <li>Potential effects on structures and underground utilities next to the tunnel alignment can be better controlled than most other methods.</li> <li>Machines can include rock-cutting face tools and internal crushers.</li> </ul>	For some systems, slurry processing systems / separation plants are required along with additional working areas at shaft locations.	<ul> <li>Relatively low risk of ground loss during tunnelling when a counterbalancing and appropriately viscous slurry and pressure is used.</li> <li>Greater risk of fluid losses to the surface compared to other methods that do not utilize slurries, but the potential of fluid losses to the surface depends on slurry composition, viscosity, pressure and the existence of available pathways (old boreholes or wells, utility bedding, etc.).</li> <li>Subsurface conditions at interface of fill and native ground may include risks of encountering wood debris or other materials that obstruct tunnelling.</li> </ul>

Installation Method	Advantages	Disadvantages	Risk / Consequences
Tunnelling with Earth-pressure balance tunnel boring machine (EPB TBM)	<ul> <li>EPB TBM is able to counterbalance earth (soil and/or rock) and groundwater pressures in a controlled manner, providing continuous face support and eliminating the need for dewatering at the tunnel face along the alignment.</li> <li>Can be steered continuously, providing good control over line and grade.</li> <li>Tunnel is fully lined as excavation progresses (i.e., precast segmental liner is installed behind the EPB TBM during forward advancement).</li> <li>Potential effects on structures and underground utilities next to the tunnel alignment can be better controlled than most other methods.</li> <li>Machines can include rock-cutting face tools and older systems that use load or pressure-controlled gates for spoil discharge from forward chamber can pass some larger potential obstructions depending on face opening and relieving gate sizes.</li> </ul>	<ul> <li>Susceptible to ground losses depending on operator control of face pressures, relieving gate or screw conveyor operations.</li> <li>Addition of appropriate conditioning agents (e.g., bentonite) may be required to modify spoil for appropriate consistency and face pressure control.</li> </ul>	<ul> <li>Relatively low risk of ground loss during tunnelling when a counterbalancing face pressure is used, and conditioning agents may be required.</li> </ul>

Installation Method	Adv	vantages	Dis	advantages	Ris	k / Consequences
Rock Tunnel Boring Machine (TBM)	•	Man-entry and access to the tunnel face is possible.	-	Rock TBM is not suitable for high groundwater level and gases present in the shale bedrock. This method is not suitable for tunnelling on overburden soils.		The tunnel face is not pressurized. Not suitable for mixed face conditions. Groundwater need to be controlled.
Traditional Jack and Bore		Tunnel is fully lined as excavation progresses (i.e., casing pipe is installed behind the boring head during forward advancement).	-	Traditional jack and bore is considered not suitable for granular material below water levels, or in granular soils above water levels if a plug of soil cannot be maintained in lead end of casing. Traditional jack and bore is considered not suitable for squeezing soils (soft cohesive soils). Difficult to control line and grade using jack and bore, potentially requiring installation of a larger culvert/casing pipe than that specified to accommodate variation during installation.		Significant potential for loss of ground into casing/pipe without dewatering of bore alignment, especially in wet/flowing conditions and even with plug of soil ahead of augers. Obstructions can result in deflection of the casing/pipe resulting in misalignment of the sewer. Cutter head can be specified to have capability for cutting through boulders.

Installation Method	Advantages	Disadvantages	Risk / Consequences
Pipe Ramming	<ul> <li>Less risk of subsidence above sewer alignment when compared to jack and bore installation methods.</li> <li>Better suited for penetrating through potential obstructions such as cobbles and boulders when compared to jack and bore methods.</li> <li>Better suited to site soils below the groundwater level when compared to jack and bore methods.</li> <li>Potentially slightly smaller footprint for entry/exit shafts than that required for jack and bore and MTBM.</li> </ul>	<ul> <li>Limited drive length.</li> <li>Difficult to control line and grade using pipe ramming.</li> <li>Potential for heaving at ground surface (where cover is thin) as a long plug of soil is maintained inside pipe – may require periodic removal of soil plug which is not recommended in saturated ground.</li> <li>Ramming vibration could affect adjacent service lines (if any).</li> <li>Noise can be a public nuisance.</li> </ul>	<ul> <li>Less risk of ground loss during tunnelling when compared to jack and bore methods.</li> <li>Obstructions can result in deflection of the casing/pipe resulting in misalignment of the sewer.</li> <li>Vibration from pipe ramming may impact adjacent buried service lines.</li> </ul>

Installation Method	Advantages	Disadvantages	Risk / Consequences
Jack and Bore with Guided Boring Machine (Pilot Tube Boring)	<ul> <li>Tunnel is fully lined as excavation progresses (i.e., sewer pipe is installed behind the boring head during forward advancement).</li> <li>Pilot tube is steered, providing better line and grade control for final installation as compared to traditional jack and bore.</li> </ul>	<ul> <li>Jack and bore with guided boring machine (GBM) are no more suitable to penetrate through granular material above and below the water table when compared to traditional jack and bore.</li> <li>Dewatering likely required along tunnel alignment to be used successfully.</li> <li>Very stiff/hard or very dense subsurface material may limit penetration of the pilot tube, depending on equipment used for advancement of pilot tube.</li> </ul>	<ul> <li>Significant potential for loss of ground into casing/pipe without dewatering of bore alignment, especially in wet/flowing conditions and even with plug of soil ahead of auger.</li> <li>Obstructions can result in deflection of the pilot tube resulting in misalignment of the sewer, although this can be better managed than for traditional jack and bore.</li> <li>Unexpectedly hard/dense ground conditions can halt penetration of the pilot tube, depending on equipment details.</li> </ul>

Installation Method	Advantages	Disadvantages	Risk / Consequences
Mechanically Assisted and Hand Mining (Shield Tunnelling)	<ul> <li>Obstructions can be easily removed by personnel at the tunnel face.</li> </ul>	<ul> <li>Typically, shield mining is not considered suitable for "flowing" conditions unless dewatering and special provisions are used to manage groundwater issues or squeezing conditions.</li> <li>Dewatering likely required along alignment to be used successfully, particularly if the tunnel is to be advanced through both existing and new embankments given water levels at north end.</li> <li>"Hooded" or angled-face shield required, and poling plates or spilling needed to control ravelling of ground near crown and above spring-line of tunnel.</li> </ul>	<ul> <li>Significant potential for loss of ground into the tunnel without proactive control of saturated conditions.</li> </ul>

#### 5.2.2 SHAFT DESIGN and CONSTRUCTION CONSIDERATIONS

Trenchless installation requires shafts as entry and exit points. The construction of shafts should consider subsurface soil and groundwater conditions. At this stage, it is recommended to assume that the support of excavations for the shafts should be constructed using a relatively watertight structure to minimize groundwater seepage into the excavation and ground movements adjacent to the shafts.

# 6.0 RECOMMENDED GEOTECHNICAL INVESTIGATIONS DURING DESIGN PHASES

## 6.1 Data Gap

The available geotechnical and hydrogeological information is limited along the proposed tunnel alignment. Most of the publicly available boreholes along the alignment were drilled to the north and south of Welland Canal, located approximately 50 m away from the proposed alignment. The location of MTO boreholes are provided in Figures 6 to 11 and borehole logs are provided in Appendix A. The database search provided very limited background geotechnical information within the study areas and very limited borehole information was available near the exit location of the sewer alignment, as shown on Figures 9 and 10, which present boreholes located approximately 700 m away from the sewer alignment.

# 6.2 Geotechnical and Hydrogeological Program

Due to insufficient information available for the design development, the following section provides information for the proposed geotechnical and hydrogeological investigations within the boundaries of the Site. During the design phases, site-specific geotechnical investigations and in-situ and laboratory testing will be required to assist with subsurface risk management and construction cost objectives. Consideration should be given to conducting the following tests during the geotechnical field surveys:

- 1) Conventional boreholes including SPT to obtained SPT and undisturbed soil samples from subsurface strata and Cone Penetration Tests (CPT) through very soft to firm/very loose to compact layers.
- 2) Continuous PQ or Sonic boreholes at shaft locations.
- 3) Monitoring well installations and in-situ hydrogeological testing of soil and rock including pumping tests.
- 4) Laboratory classification testing including water content determination; Atterberg limits tests; and grain size distributions.
- 5) Laboratory and in-situ strength testing in soil and bedrock.

# 7.0 CLOSURE

We trust this report these meets your current needs. If you have any questions, please contact the undersigned.

# IMPORTANT INFORMATION AND LIMITATIONS OF THIS REPORT

**Standard of Care**: Golder Associates Ltd. (Golder) has prepared this report in a manner consistent with that level of care and skill ordinarily exercised by members of the engineering and science professions currently practising under similar conditions in the jurisdiction in which the services are provided, subject to the time limits and physical constraints applicable to this report. No other warranty, expressed or implied is made.

**Basis and Use of the Report:** This report has been prepared for the specific site, design objective, development and purpose described to Golder by the Client. The factual data, interpretations and recommendations pertain to a specific project as described in this report and are not applicable to any other project or site location. Any change of site conditions, purpose, development plans or if the project is not initiated within eighteen months of the date of the report may alter the validity of the report. Golder cannot be responsible for use of this report, or portions thereof, unless Golder is requested to review and, if necessary, revise the report.

The information, recommendations and opinions expressed in this report are for the sole benefit of the Client. No other party may use or rely on this report or any portion thereof without Golder's express written consent. If the report was prepared to be included for a specific permit application process, then upon the reasonable request of the client, Golder may authorize in writing the use of this report by the regulatory agency as an Approved User for the specific and identified purpose of the applicable permit review process. Any other use of this report by others is prohibited and is without responsibility to Golder. The report, all plans, data, drawings and other documents as well as all electronic media prepared by Golder are considered its professional work product and shall remain the copyright property of Golder, who authorizes only the Client and Approved Users to make copies of the report, but only in such quantities as are reasonably necessary for the use of the report or any portion thereof to any other party without the express written permission of Golder. The Client acknowledges that electronic media is susceptible to unauthorized modification, deterioration and incompatibility and therefore the Client can not rely upon the electronic media versions of Golder's report or other work products.

The report is of a summary nature and is not intended to stand alone without reference to the instructions given to Golder by the Client, communications between Golder and the Client, and to any other reports prepared by Golder for the Client relative to the specific site described in the report. In order to properly understand the suggestions, recommendations and opinions expressed in this report, reference must be made to the whole of the report. Golder can not be responsible for use of portions of the report without reference to the entire report.

Unless otherwise stated, the suggestions, recommendations and opinions given in this report are intended only for the guidance of the Client in the design of the specific project. The extent and detail of investigations, including the number of test holes, necessary to determine all of the relevant conditions which may affect construction costs would normally be greater than has been carried out for design purposes. Contractors bidding on, or undertaking the work, should rely on their own investigations, as well as their own interpretations of the factual data presented in the report, as to how subsurface conditions may affect their work, including but not limited to proposed construction techniques, schedule, safety and equipment capabilities.

**Soil, Rock and Ground Water Conditions:** Classification and identification of soils, rocks, and geologic units have been based on commonly accepted methods employed in the practice of geotechnical engineering and related disciplines. Classification and identification of the type and condition of these materials or units involves judgment, and boundaries between different soil, rock or geologic types or units may be transitional rather than abrupt. Accordingly, Golder does not warrant or guarantee the exactness of the descriptions.

Special risks occur whenever engineering or related disciplines are applied to identify subsurface conditions and even a comprehensive investigation, sampling and testing program may fail to detect all or certain subsurface conditions. The environmental, geologic, geotechnical, geochemical and hydrogeologic conditions that Golder interprets to exist between and beyond sampling points may differ from those that actually exist. In addition to soil variability, fill of variable physical and chemical composition can be present over portions of the site or on adjacent properties. The professional services retained for this project include only the geotechnical aspects of the subsurface conditions at the site, unless otherwise specifically stated and identified in the report. The presence or implication(s) of possible surface and/or subsurface contamination resulting from previous activities or uses of the site and/or resulting from the introduction onto the site of materials from off-site sources are outside the terms of reference for this project and have not been investigated or addressed.

Soil and groundwater conditions shown in the factual data and described in the report are the observed conditions at the time of their determination or measurement. Unless otherwise noted, those conditions form the basis of the recommendations in the report. Groundwater conditions may vary between and beyond reported locations and can be affected by annual, seasonal and meteorological conditions. The condition of the soil, rock and groundwater may be significantly altered by construction activities (traffic, excavation, groundwater level lowering, pile driving, blasting, etc.) on the site or on adjacent sites. Excavation may expose the soils to changes due to wetting, drying or frost. Unless otherwise indicated the soil must be protected from these changes during construction.

**Sample Disposal:** Golder will dispose of all uncontaminated soil and/or rock samples 90 days following issue of this report or, upon written request of the Client, will store uncontaminated samples and materials at the Client's expense. In the event that actual contaminated soils, fills or groundwater are encountered or are inferred to be present, all contaminated samples shall remain the property and responsibility of the Client for proper disposal.

**Follow-Up and Construction Services:** All details of the design were not known at the time of submission of Golder's report. Golder should be retained to review the final design, project plans and documents prior to construction, to confirm that they are consistent with the intent of Golder's report.

During construction, Golder should be retained to perform sufficient and timely observations of encountered conditions to confirm and document that the subsurface conditions do not materially differ from those interpreted conditions considered in the preparation of Golder's report and to confirm and document that construction activities do not adversely affect the suggestions, recommendations and opinions contained in Golder's report. Adequate field review, observation and testing during construction are necessary for Golder to be able to provide letters of assurance, in accordance with the requirements of many regulatory authorities. In cases where this recommendation is not followed, Golder's responsibility is limited to interpreting accurately the information encountered at the borehole locations, at the time of their initial determination or measurement during the preparation of the Report.

**Changed Conditions and Drainage:** Where conditions encountered at the site differ significantly from those anticipated in this report, either due to natural variability of subsurface conditions or construction activities, it is a condition of this report that Golder be notified of any changes and be provided with an opportunity to review or revise the recommendations within this report. Recognition of changed soil and rock conditions requires experience and it is recommended that Golder be employed to visit the site with sufficient frequency to detect if conditions have changed significantly.

Drainage of subsurface water is commonly required either for temporary or permanent installations for the project. Improper design or construction of drainage or dewatering can have serious consequences. Golder takes no responsibility for the effects of drainage unless specifically involved in the detailed design and construction monitoring of the system. GM BluePlan Engineering Ltd.

## 1 Introduction

WSP Canada Inc. (WSP) was retained by the Region of Niagara to undertake a preliminary geotechnical investigation for the proposed trunk sewer installation from the existing High Lift Sewage Pumping Station (SPS), along Montrose, Brown and Reixinger Roads, to the proposed location of a new Wastewater Treatment Plant (WWTP) at 6811 Reixinger Road.

The purpose of the investigation was to determine the subsurface conditions at the borehole locations and from the findings in the boreholes to make geotechnical engineering recommendations for the proposed watermain.

It is understood the proposed 1500 mm and 1800 mm concrete trunk sewer will be installed as part of South Niagara Falls Wastewater Solution project. It is further understood the invert of the proposed pipe will be at about 9.8m to 22.0m below existing ground.

This report is provided on the basis of the terms of reference presented above and, on the assumption, that the design will be in accordance with the applicable codes and standards. If there are any changes in the design features relevant to the geotechnical analyses, or if any questions arise concerning the geotechnical aspects of the codes and standards, this office should be contacted to review the design. It may then be necessary to carry out additional borings and reporting before the recommendations of this office can be relied upon.

The site investigation and recommendations follow generally accepted practice for geotechnical consultants in Ontario. The format and contents are guided by client specific needs and economics and do not conform to generalized standards for services. Laboratory testing for most part follows ASTM or CSA Standards or modifications of these standards that have become standard practice.

This report has been prepared for the Region of Niagara. Use of this report by third party without WSP consent is prohibited.

## 2 Field and Laboratory Works

### 2.1 Geotechnical Boreholes and Field Testing

The field investigation consisted of drilling a total of seventeen (17) exploratory boreholes (BH20-1 through BH20-12S/D and BH-P01 to BH-P03, see **Drawings 2** to **10** for borehole locations) to depths ranging from 4.6 of 39.6 m below ground surface.

A summary of the borehole data is presented in **Table 2.1**.

Location	Easting		Northing	Approximate Ground Elevation (m)	Depth of Borehole (m)	Note
		NAD83, UT	M Zone 17

Table 2.1Summary of Borehole Information

Borehole locations for this investigation were established by WSP personnel in accordance with the Region of Niagara requirements. Prior to drilling operations, all underground utilities were cleared at the borehole locations.

The field investigation work of drilling the boreholes were undertaken on December 2 to 23, 2020 by a drilling sub-contractor under the direction and supervision of WSP personnel. Borehole logging services were provided by the engineering staff of WSP. The boreholes were advanced with power auger drilling machines equipped with hollow stem augers. The soil stratigraphy was recorded by observing the quality and changes of augered materials which were retrieved from the boreholes, and by sampling the soils at regular intervals of depth using a 50 mm O.D. split spoon sampler, in accordance with the Standard Penetration Test (ASTM D 1586) method. This sampling method recovers samples from the soil strata, and the number of blows (SPT 'N'-values) required to drive the sampler 0.3 m depth into the undisturbed soil gives an indication of the compactness condition or consistency of the sampled soil material. The SPT 'N' values are indicated on the borehole log sheets (Refer to **Appendix A**). Soil samples were visually classified in the field and later re-evaluated in our laboratory.

Upon encountering bedrock in BH20-01, BH20-03 to BH20-05, BH20-07D, BH20-08 and BH20-09, coring of the rock was affected with HQ-2 size double tube wireline equipment, allowing recovery of 63mm diameter rock cores. The monitoring technician recorded the standard penetration test resistances and visually described the soil and rock samples. The Total Core Recovery (TCR), Solid Core Recovery (SCR), Rock Quality Designation (RQD) values and Fracture Indices (FI) were recorded for the rock cores in accordance with the conventions used by the International Society for Rock Mechanics (ISRM). An explanation of these terms is presented in the fly sheet at the beginning of **Appendix A**. Photographs of the recovered cores are provided in **Appendix D**.

The ground surface elevations at the borehole locations were surveyed by WSP and referenced to a geodetic datum.

Groundwater monitoring wells were installed in thirteen (13) boreholes and the groundwater level measured from the monitoring wells are provided in Section 3.7.

## 2.2 Geotechnical Laboratory Testing

The soil samples were taken to our laboratory where they were re-examined. Representative samples were selected for geotechnical index testing. The testing program consisted of the measurement of the natural moisture content of all available soil samples, grain size analyses on twenty-one (21) selected samples and consistency (Atterberg) limits for nine (7) soil samples and two (2) soil unit weight. A one-dimensional consolidation test performed on undisturbed sample collected from soft clay and the results are attached in **Appendix E**. Test results are

shown on the individual borehole logs presented in **Appendix A**. The grain size analysis curves and results of the consistency (Atterberg) limit tests are plotted on **Figures 1 to 9** attached to this report in **Appendix B**.

Testing of the rock cores consisted of point load index strength tests on six (6) samples, unconfined compressive strength (UCS) tests on six (6) rock samples with measurement of unit weight ( $\gamma$ ). These test results are provided in **Appendix D**. Results of point load tests and unconfined compressive strength are also presented on the borehole log sheets of **Appendix A**.

## **3 Subsurface Conditions**

The borehole location plan and profiles are shown in **Drawings 1** to **10** and explanation of terms used in the record of borehole are presented in **Appendix A**. The subsurface conditions in the boreholes are presented on individual borehole logs (Refer to **Appendix A**). The subsurface conditions in the boreholes are summarized in the following paragraphs.

## 3.1 Pavement/Topsoil/Fill Material

The boreholes BH20-10 to BH20-12 were drilled on agricultural land and encountered about 150mm to 230mm of topsoil at the surface.

Five boreholes (BH20-02, BH20-03, BH20-05, BH20-06D, and BH20-09) were encountered 100mm to 150mm thick asphalt at the surface. 50mm and 700mm granular base material encountered in borehole BH20-05 and BH20-09, respectively. Below asphalt, 6.4 m thick crushed run limestone was encountered in BH20-02; 1.3 m thick granular fill was encountered in BH20-03; 50 mm granular fill and 0.9m crusher run limestone were encountered in BH20-05; 1.7 m thick crushed run limestone was encountered in BH20-06D; and 0.7 m thick granular fill was encountered in BH20-09. 0.8 m thick crushed run limestone was also encountered within the silty clay fill in BH20-06D

0.1 to 0.8 m thick crushed run limestone was encountered at ground surface in BH20-04 and BH20-07D.

Silty clay fill was encountered in some boreholes to depths varying from 1.1 to 5.7 m below ground surface (mbgs). Trace to some inclusions of organics were noted in the fill material. Fill was present in soft to very stiff consistency, with measured SPT 'N' values varying from 3 to 27 blows per 300 mm of penetration.

One (1) selected silty clay fill samples (BH20-3/SS6) were subjected to grain size analysis. Gradation curve is presented in **Figure 1** of **Appendix B** and summarized below:

Gravel:	0 %
Sand:	1 %
Silt and clay:	99 %

Atterberg limit testing was performed on the same sample (BH20-3/SS6) and the results is provided on **Figure 2** in **Appendix B**. The results of this testing indicated liquid limits of 54, plastic limits of 25, and plasticity indexes of 29. Based on this, the soil is classified as silty clay to clay of high plasticity (CH) according to the Unified Soil Classification System.

## 3.2 Silty Clay

Below the fill material in all boreholes a deposit of silty clay was encountered at depths of 1.1 to 6.6 mbgs and extended to depths of 4.6 to 23.2 mbgs. The borehole BH20-10 to BH20-12 were terminated within this cohesive deposit.

The cohesive deposit was found to be in a very soft to hard consistency with measured SPT 'N' value of nil blows to 30 blows per 300 mm of penetration. The water content obtained from the samples revealed from this deposit were 6 to 40%.

A layer of organic clay was embedded within the silty clay deposit in borehole BH20-06 at depths of 7.2 to 9.3 mbgs with measured SPT 'N' value of 0 to 4 blows per 300 mm of penetration and natural moisture content of 102 to 117%. The SPT 'N' value of 0 blow per 300 mm means the sampler settles more than 300 under the weight of 63.5 kg hammer.

Shear vane in-situ test was carried out within the silty clay deposit at regular intervals where the SPT 'N' values below 10 blows for 300 mm penetration. Shear vane testing within the silty clay deposit yielded shear strengths 28 to 59 kPa, indicating a firm to stiff consistency. The sensitivity ranged from 1.0 to 3.3.

One oedometer test was conducted on the silty clay sample at a depth of 6.6 mbgs. The test shows a compression index of 0.72, recompression index of 0.06, void ratio of 1.0, unit weight of 18.3 kN/m<sup>3</sup> and preconsolidation pressure of 180 kPa.

A layer of silt was interbedded within the silty clay deposit in borehole BH20-03, BH20-08 and BH20-09 at depths of 4.6 to 13.3 mbgs and extended to depths of 5.3 to 14.8 mbgs. The silt deposit was found to be in loose to compact state of compactness with measured SPT 'N' value of 8 to 24 blows per 300 mm penetration. The natural moisture content obtained from the sample reveled from silt layer was 24 to 27%.

Seventeen (17) selected silty clay samples were subjected to grain size analysis and Atterberg limit testing was performed on eight (8) samples and the results are provided on **Figure 3** in **Appendix B**. Gradation curves are presented in **Figure 4** of **Appendix B** and the result of gradation and Atterberg limit test are summarized in table below:

Borehole No.	Sample No.	Gravel %	Sand %	Silt and Clay %	Plastic Limit	Liquid Limit	Plastic Index
BH20-01	SS5	0	1	99	23	51	28
BH20-01	SS9	0	1	99	20	37	17
BH20-02	SS11	0	0	100	-	-	-

Report on Preliminary Geotechnical Investigation for Proposed South Niagara Falls Wastewater Treatment Plant (WWTP) and Associated Trunk Sewer, Township of Willoughby, Region of Niagara Project No. 201-11602-00 Region of Niagara

BH20-03	SS5	0	0	100	17	31	14
BH20-04	SS9	0	4	96	16	31	15
BH20-04	SS12	0	0	100	-	-	-
BH20-04	SS14	0	0	100	-	-	-
BH20-05	SS9	0	2	98	19	37	18
BH20-05	SS14	0	5	95	17	26	9
BH20-06	SS16	4	3	93	-	-	-
BH20-07	SS18	0	15	85	-	-	-
BH20-09	SS12	0	5	95	17	27	10
BH20-09	SS15	5	8	87	18	34	16
BH20-09	SS17	0	4	96	-	-	-
BH20-10	SS11	1	5	94	-	-	-
BH20-11	SS11	0	4	96	-	-	-
BH20-12	SS11	1	6	93	-	-	-

Based on this, the soil is classified as low to high plasticity silty clay or clay (CL or CH) according to the Unified Soil Classification System.

## 3.3 Clayey Silt Till

A deposit of clayey silt till deposit was encountered below the silty clay layer in borehole BH20-1 and below silt layer in boreholes BH20-2 and BH20-7 locations at depths of 10.2 to 24.7 mbgs. The clayey silt deposit was extended to the borehole depths of 11.7 to 26.4 mbgs.

Boulders/cobbles within the till deposit were interfered during the borehole drilling due to high SPT 'N' value and nature of deposit. The current investigation method could not determine the size and frequency of boulder and cobbles.

In general, SPT 'N' values in this deposit ranged from 7 to more than 50 blows per 300mm penetration, corresponding to firm to hard consistency. The moisture content of samples recovered from cohesionless deposit ranged between 8% to 24%.

A selected clayey silt till sample (BH20-1/SS12) was subjected to grain size analyses. Gradation curve is presented on **Figures 5** of **Appendix B** and summarized below:

Gravel:	11%
Sand:	32%
Silt:	45%
clay:	12%

## 3.4 Sandy Gravel/Sand/Silt and Sand/Silt

Below the silty clay layer or below clayey silt till deposit in all boreholes, a deposit of cohesionless soils comprised of silt, silt and sand & sandy gravel was encountered at depths of 11.7 to 23.2 mbgs and extended to depths of 14.3 to 27.4 mbgs. The cohesionless deposit was found in very loose to very dense state of compactness with measured SPT 'N' value of 2 to over 50 blows per 300 mm penetration. Water contents ranged from 9% to 27%.

Boulders/cobbles should be expected within the cohesionless deposit due to their nature of deposit.

Three (3) selected silt to silty sand samples (BH20-1/SS13, BH20-3/SS17 and BH20-4/SS15) were subjected to grain size analyses. Gradation curves are presented on **Figures 6** of **Appendix B** and summarized below:

Gravel:	3 to 26%
Sand:	5 to 40%
Silt And Clay:	34 To 92%

## 3.5 Clayey Silt (Residual Soil)

Localized clayey silt (residual soil) clay deposit in borehole BH20-09. The residual soil deposit extended to a depth of 19.9 mbgs. The deposit hard clayey silt matrix containing extensive broken bedrock slabs and fragments. This stratum was difficult to auger due to the fragmented dolostone content and given its hard condition. The natural moisture content measured in the test sample from these materials was 13%.

This complex is a transitional deposit between bedrock and the overlying soil or may be the completely to highly weathered bedrock. This deposit has characteristics of both the bedrock and soil. The rock slabs found within the soil matrix can be quite large in size (0.5m to 1m or more).

## 3.6 Bedrock

Dolostone of Salina Formation was cored and inferred due to auger/spoon refusal in boreholes BH20-01, BH20-03, BH20-04, BH20-05, BH20-06D, BH20-07D, BH20-08 and BH20-09 at depths ranging from 14.3 to 29.3 m below the existing ground surface, corresponding to Elevation 147.6 to 166.1 m, as listed in **Table 3.1**. Bedrock was proven by bedrock coring in boreholes BH20-01, BH20-03, BH20-04, BH20-05, BH20-07, BH20-08 and BH20-09. Rock core logs are provided on borehole logs appended in **Appendix A** and the photographs of the rock cores are provided in **Appendix D** of this report. The rock core mainly consists of dolostone.

Borehole No.	Existing Ground Surface Elevation (M)	Depth Of Bedrock Surface Below Existing Ground (M)	Approximate Elevation of Bedrock Surface (M)	Notes
BH20-01	180.5	14.3	166.1	Bedrock coring
BH20-03	178.1	15.2	162.9	Bedrock coring
BH20-04	178.9	16.5	162.5	Bedrock coring
BH20-05	177.8	23.8	154.1	Bedrock coring
BH20-	175.8	27.4	148.4	Augering
BH20-	177.1	26.4	150.7	Bedrock coring
BH20-08	176.9	29.3	147.6	Bedrock coring
BH20-09	176.0	20.9	155.1	Bedrock coring

#### Table 3.1 Approximate Depth and Elevation of Bedrock Surface

Because of the method of drilling and sampling, the surface elevations of the bedrock may be different than indicated on the borehole logs. With augering, the auger may penetrate some of the more weathered dolostone and the coring may therefore begin below the bedrock surface. As such, the interred bedrock surface level should not be considered accurate to better than +/-1.5m.

The descriptive terms used on the record of rock cores and throughout this report are explained on the "Explanation of Terms Used in the Bedrock Core Log" sheet in **Appendix A**. In general, the conventions of the International Society for Rock Mechanics (ISRM) are

adopted herein. Detailed descriptions of the index properties and results of laboratory testing are presented in the following paragraphs.

Six-point load index strength tests were performed on dolostone rock samples. The test results are presented in individual borehole logs. The equivalent unconfined compressive strength of rock samples was inferred to range from 40.0 to 189.0 MPa in axial direction with average strength of 92.8 MPa and from 24.0 to 96.0 MPa in the diametral direction with average strength of 56.8 MPa. The values are indicative "weak" to "very Strong", but generally "medium strong" to "very strong" rock under ISRM strength convention.

The UCS of the tested samples of bedrock ranged from 100 to 223.5 MPa. The test results indicated that the dolostone samples are "strong" to "very strong" rock under the ISRM strength convention. Results of point load tests and unconfined compressive strength are also presented on the borehole log sheets and appended in **Appendix C**.

#### 3.6.1 Total Core Recovery (Tcr)

The total core recovery indicates the total length of rock core recovered, expressed as a percentage of the actual length of the core run. The total core recovery ranged from 58% to 100%. Generally, low core recovery was experienced only near the surface of the rock, where the formation is more weathered.

#### 3.6.2 Solid Core Recovery (Scr)

The solid core recovery is the total length of solid, full diameter rock core that was recovered, expressed as a percentage of the length of the core run. Solid core recovery ranged from 23% to 100% but generally was found to be in the range of 70% to 100% generally improving with depth. The SCR index is influenced by the orientations of the fractures.

#### 3.6.3 Rock Quality Designation (Rqd)

The rock quality designation index is obtained by measuring the total length of recovered rock core pieces which are longer than 100 mm and expressing the sum total length as a percentage of the length of the core run. RQD is a function of the frequency of joints, bedding plane partings and fractures in the rock cores. On the basis of the recorded RQD values which range from nil to 100%, the rock quality is estimated to be "very poor" to "excellent", and the average value of 64.3% suggests a rock of generally "fair" quality.

#### 3.6.4 Fracture Index

When logging the rock cores, the fracture Index (i.e. the number of fractures for each 0.3 m length of core) was also recorded. It was observed that the planes of weaknesses along which the cores tended to break, included planes of fissility and bedding, and some oblique and subvertical joints.

## 3.7 Groundwater Conditions

The groundwater levels measured in the monitoring wells installed along proposed trunk sewer and WWTP investigation are summarized in **Table 3.2**.

Borehole No.	Date Of Drilling	Existing Ground Elevation (m)	Date Of Water Measurement	Screen Depth (m)		Groundwater Level Depth (m)	Groundwater Level Elevation (m)

It should be noted that the groundwater levels can vary and are subject to seasonal fluctuations in response to major weather events. The possibility of groundwater level fluctuations should be considered when developing the design and construction plans for the project.

Refer to WSP's report entitled "Preliminary Hydrogeological Investigation – South Niagara Falls WW Solutions EA, Niagara Region, ON", dated May 27, 2022 for detailed discussions on the groundwater.

## 4 Geotechnical Interpretation and Recommendations

In this section, the subsurface conditions are interpreted as relevant to the design and construction of the proposed sewer trunk installation in Section 4.4, shaft installation in Section 4.5, and construction of wastewater treatment plant in Section 4.6 at the aforementioned sites. Comments relating to construction are intended for the guidance of Region of Niagara and its designers to establish the construction method.

The construction methods described in this report must not be considered as being specifications or direct recommendations to contractors, or as being the only suitable methods. Prospective contractors should evaluate all of the factual information, obtain additional subsurface information as they might deem necessary and should select their construction methods, sequencing and equipment based on their own experience in similar ground conditions. The readers of this report are also reminded that the conditions are known only at the borehole locations and in view of the generally wide spacing of the boreholes, conditions may vary significantly between boreholes.

## 4.1 Overview Of Subsurface Conditions and Recommended Geotechnical Parameters

#### 4.1.1 Overview Of Subsurface Conditions

In simplified terms, the subsurface profile consists of pavement structure, topsoil or surficial fill material underlain by a native very soft to very stiff (occasional hard spot) cohesive silty clay textures, the cohesive deposit followed by sand to gravelly sand deposit or clayey silt till deposit. The bedrock underlaying the site at depths of 14.3 to 29.3 mbgs (Elev. 147.6 to 166.1 m). At the monitoring well locations, the groundwater table lies between 2.3 and 11.0 mbgs (between Elev. 167.9 m and 178.2 m). Perched water should be expected in the shallow granular fill and in any granular fill in the existing nearby utility trenches.

Borehole locations and subsurface profiles of the trenchless and open cut sections are presented in **Drawing Nos. 1** through **10**.

#### 4.1.2 Recommended Design Parameters For Soil And Groundwater

Suggested soil parameters (unfactored) for the design of pumping station, chambers/manholes and ground support systems are summarized in **Table 4.1**. The suggested soil parameters are based on SPT 'N'-values, soil laboratory test results and supplemented by the judgement based on local and regional experience with these soil types.

New Granular Soil Type Fill Spt 'N'			Existing Fill	Cohesive Native Soils - Silty Clay/Clayey Silt				Non-Cohesive Native Soils –Sand, Sandt Gravel, Silty Sand Gravely nd Silt

POISSION'S RATIO	-	-	0.3	0.3	0.3	0.3	0.3	0.3	0.3	0.3	0.3

 Table 4.1
 Recommended Unfactored Soil Parameters

Soil Type Spt 'N'	New Granular Ex Fill		Existing Fill	Cohesive Native Soils - Silty Clay/Clayey Silt			Non-Cohesive Native Soils –Sand, Sandt Gravel, Silty Sand Gravely nd Silt				
	'A'	'B'	2-18	1-7	8-14	15-29	≥30	1-9	10- 19	20-49	≥50
MODULUS OF SUBGRADE REACTION, K (MN/m³) (*)	-	-	4/B	4/B	8/B	15/B	30/B	4/B	5/B	30/B	50/B
LATERAL MODULUS OF SUBGRADE REACTION, Ks (MN/m <sup>3</sup> ) (*)	-	-	4/B	4/B	8/B	15/B	30/B	4/B	5/B	30/B	50/B

(\*) B is the width of footing/Pipe in metres.

(\*\*) The recommended undrained shear strength is used for the structural design, not for the selection of the excavation machine for which an undrained shear strength of up to 1000 kPa should be considered.

For the design purpose the groundwater level must be taken as the higher of 1m higher than the measured groundwater level in the nearest monitoring wells and the regional flood level.

#### 4.1.3 Cobbles and Boulders

Boulders/cobbles were inferred based on auger grindings and high SPT 'N' value in the cohesionless and till deposit as well as residual soils. A very slow rate of drilling advancement was experienced during augering of these deposits given their heavily overconsolidated nature and presence of cobbles/boulders. The current investigation method of borehole drilling could not determine the size and frequency of the cobbles and boulder.

Cobbles are defined as rock fragments that cannot pass through a screen with 75 mm square openings and are less than 300 mm in maximum dimension. Boulders are defined as rock fragments with their maximum dimension being equal to or greater than 300 mm. Removal of cobbles during open cut excavations is considered part of routine construction and these materials will not be considered as obstructions for this project.

Boulders and other obstructions including but not limited to construction debris will be randomly distributed within the fill. Considering that the fill materials extend from the ground

surface to relatively shallow depths, it is not considered necessary, and it is not feasible, to estimate the frequency of obstruction within the fill.

The majority of boulders within the cohesionless deposit are expected to be generally less than 1 m in diameter; however, boulders with maximum dimensions of between 2 and 3 m have been encountered in excavations in the soil deposits of Southern Ontario. Cobbles and boulders shall be assumed to be comprised of Canadian Shield derived igneous or metamorphic rock of "extremely high" Cerchar abrasiveness and "very strong to extremely strong" unconfined strength (100 MPa to 250 MPa), as defined by ISRM (International Society for Rock Mechanics).

For preliminary geotechnical design, boulders (maximum dimension > 300mm) will comprise the following percentages by total volume of excavated soils based on local and regional experience:

- Cohesionless deposit 0.5%
- Glacial till deposit 0.5%
- Residual soil 2.5%

## 4.2 Frost Depth

All pipes and footings must have at least 1.1 m of earth cover for frost protection.

## 4.3 Seismic Site Classification

Based on the borehole information and according to Table 4.1.8.4.A of OBC 2012, the subject site for the proposed structures founded on native soils and bedrock can be classified as 'Class D' and "Class C' for seismic site response, respectively.

### 4.4 Trunk Sewer Installation with Trenchless Method

Based on information provided in the preliminary design drawing the majority of the proposed sewer trunk will be installed using trenchless techniques. The information provided by borehole BH20-1 to BH20-5 and BH20-9 as shown in **Drawing Nos. 2** to **10** indicate that within the proposed trunk sewer alignment, the soils mainly consist of soft to firm silty clay and compact to very dense silty sand to sand and gravel, and the soil will be very stiff to hard silty clay or loose to very dense cohesionless deposit at alignment with the location of boreholes BH20-06D/S to BH20-07D/S . Obstructions such as boulders/cobbles in the dense to very dense

cohesionless deposit should be expected. The groundwater level was varying from 2.3 m to 11.0 m below existing ground surface corresponding to elevation 167.9 to 178.2 m.

The soft to firm silty clay for the purpose of tunnelling can be categorized as "squeezing" and the cohesionless deposit below groundwater table should be consider as "flowing", "fast ravelling" and "bouldery" ground in accordance with the behaviouristic ground classification system established by Terzaghi in 1950. (Refer to **Appendix F** for definitions of ground performance in tunnelling). The silty clay should be considered as "sticky" clay for tunnelling. In general, trenchless condition is considered to be challenging due to presence of the soil deposits ranged from soft cohesive soil to very dense cohesionless soils as well as cobbles/boulders within the cohesionless soils and high groundwater table.

It is understood that microtunnel boring machine (MTBM) will be used for the installation of trunk sewer. In this case, following should be considered:

The MTBM is capable to operate within the soft to firm clay with lowest SPT N-value of 2. Alternatively, consideration should be given to improve the soft to firm soils using soil improvement methods such as jet grout or other methods; and

Additional geotechnical investigation with borehole drilling, piezocone penetration tests and laboratory tests for the design of concrete pipe and soil improvement.

Alternatively, consideration should be given to lower the proposed trunk sewer alignment into the bedrock or dense to very cohesionless soil from Sta. 1+020 to approximately 3+080. Additional deep borehole drilling, rock coring and testing are required to conform the bedrock surface and properties.

### 4.5 Sealed Shafts

It is proposed to construct seven (7) sealed shafts (six shafts will be of diameter 3 m and one will be of 1.8 m diameter) that will be used to launch and receive the tunneling equipment, including the sanitary sewers. On completion of the tunneling work, all the seven shafts will be converted to sanitary sewer manholes. The excavation for the shafts will penetrate through fill, cohesive soils (till and non-till silty clay) and cohesionless soils (silt, sand, sand and gravel, gravelly sand). The shafts can consist of cast-in-place concrete circular shafts constructed top-down, excavated in–the-wet progressively as the concrete ring segments are cast and pushed down. Mass concrete plug is recommended to be placed at the shaft bottom to form a working base.

Alternatively contiguous caisson walls or Continuous interlocked steel sheet piles toed into the bedrock can be considered to minimize the need of dewatering for the construction of shafts.

The groundwater inflow during construction within a sealed shaft can be removed using sump pumps.

The design and construction of the permanent shaft support will be the responsibility of the contractor who must retain a specialist shoring design engineer. All shoring designs shall be in accordance with the 4th Edition of the Canadian Foundation Engineering Manual and must be reviewed by a Geotechnical Consultant. For cast-in-place concrete circular shafts, the coefficient of earth pressure at rest ( $K_0$ ) as recommended in Table 4.1 should be used.

#### 4.5.1 Lateral Earth Pressure

The lateral earth pressure can be evaluated from the following equation.

 $P = K_0 (\gamma h + q) + \gamma_W h$ 

where p = lateral earth pressure in kPa acting at depth h

 $K_0$  = coefficient of lateral earth pressure, taken the value from Table 4.1

 $\gamma$  = unit weight of backfill, taken the value from Table 4.1

h = depth below ground surface, m

q = surcharge load at ground surface kN/m<sup>2</sup>

 $\gamma_W$  = unit weight of water = 10 kN/m<sup>3</sup>

For design purpose, the groundwater level must be taken as the higher of 1m higher than the measured groundwater level in the nearest monitoring wells and the regional flood level.

If the ground surface is not horizontal due to excavation for the open cut section or because of the natural ground, then the uneven portion can be treated as an equivalent surcharge.

During freezing conditions, the shored walls must be protected against frost penetration and the build-up of frost pressure behind the wall.

#### 4.5.2 Uplift Pressure

The sealed shafts and the permanent structures (the MHs) should be designed as water-tight structure, and uplift forces on the shaft structure should assume buoyancy forces corresponding to the high design ground water level shall be taken as the higher of 1m higher than the measured groundwater level in the nearest monitoring wells and the regional flood level.

If the combination of the weight of the structure and the mobilized frictional resistance between the buried portion of the exterior walls and the backfill materials is insufficient to resist the uplift forces during any stage of the construction and/or during the operation of the structure, then a fail-safe system of grouted ground anchors is needed.

Post tensioned pressure-grouted soil anchors bonded into firm to stiff silty clay and compact gravelly sand can be designed using an allowable bond resistance of 30 kPa, but in no case should the bonded length be less than 4m. The group ground anchor capacity should be the minimum of (a) the sum of the individual anchor capacity or (b) the sum of the shear (bond) resistance mobilised on the surface perimeter area of the group and the effective weight of anchor/soil enclosed by this perimeter.

Pressure-grouted rock anchors can be designed using an allowable bond resistance of 300 kPa, but in no case should the bonded length be less than 4m.

The actual capacity (bond resistance) of the anchors should be established by at least two (2) full scale pull-out tests ("performance test") in accordance with Canadian Foundation Manual (4th edition), testing to 200% of working load. Each installed anchor must be proof loaded to 1.33 times the design working load, in accordance with Post-Tensioning Institute (PTI) guidelines.

Permanent ground anchors should be double-corrosion protected (i.e. PTI Class I).

Friction between the exterior walls and the granular backfill materials should only be taken into account if it is absolutely certain that no excavations will be undertaken around the exterior walls any time in the future. In this case, an ultimate friction factor of 0.4 applied to the horizontal earth pressure on the wall could be used, the average coefficient of earth pressure of 0.53, and unit weight of 10.7 kN/m<sup>3</sup> below groundwater table can be used in the calculation of horizontal earth pressure. When checking the overall stability of the structure, the design should incorporate a minimum safety factor of 1.1 when using only the dead weight of the structures. The safety factor to be used for the frictional resistance should not be less than 2.0.

### 4.6 Wastewater Treatment Plant

We understand that buildings, chambers, tanks, pumping station, roadways and yard piping will be constructed at the proposed wastewater treatment plant (WWTP).

#### 4.6.1 Foundations

Boreholes BH20-8 and BH20-10 to BH20-12 were drilled in the area of WWTP. Boreholes BH20-10 to BH20-12 were drilled to a depth of 9.8 m and were terminated within the overburden. However, Borehole BH20-8 was drilled and cored to a depth of 39.6 m below existing grade. As per borehole BH20-8, the subsurface conditions in general consisted of firm to stiff clayey fill extending to a depth of 1.5m below the existing grade, which in-turn was

followed by very soft to stiff silty clay extending to a depth of 13.3 m, further underlain by a compact dilatant silt extending to a depth of 14.8 m, further underlain by very soft to stiff silty clay extending to a depth of 23.2 m, further underlain by compact dilatant silt extending to a depth of 29.3 m below the existing ground surface. Bedrock of Salina Formation was encountered at a depth of 29.3 m below existing grades. The highest groundwater level measured in monitoring wells installed at BH20-8, BH20-10, BH20-11 and BH20-12 (shallow and deep) range from 3.7 m (Elev. 171.2 m) to 6.7 m (Elev. 169.8 m) below existing ground surface.

The geotechnical conditions at the site are suitable to support the buildings and chambers on steel H-piles.

Based on the borehole, it is likely that steel H-piles (HP310x110) extended approximate depth of 32 m long, driven at least 1 m into the bedrock can support a geotechnical reaction of 1000 kN/pile at the Serviceability Limit States (SLS) and a factored geotechnical bearing resistance of 1300 kN/pile at the Ultimate Limit States (ULS) in compression, provided the factored geotechnical resistance at ULS and geotechnical reaction at SLS are confirmed by dynamic testing procedures, ASTM D4945, using the Pile Driving Analyzer (PDA). Piles shall be driven about 1 m above the design elevation and then PDA testing must be carried out. Piles will need to be driven until the required ultimate capacity is achieved. A factor of safety of minimum 2.0 should be adopted to derive the factored geotechnical resistance of pile at ULS from the unfactored ultimate bearing capacity of pile. A minimum factor of safety equal to three (3) will be required to derive the geotechnical reaction at SLS from the ultimate bearing capacity of pile. Higher geotechnical reaction at SLS and factored geotechnical resistance at ULS could be used, provided it is confirmed by the field-testing using PDA.

The pile-driving hammer must be capable of driving the piles to the required capacity without damaging it. To achieve this, the hammer should have a rated energy of about 100 kilojoules per blow. An energy transfer of at least 40 percent of the pile driven rating is assumed. The cap-block may be modified to minimize over stressing of the pile.

Pile driving should be observed, on a full-time basis, by an experienced soil technician, who will record penetration resistance, pile toe elevation, etc. The technician must be supervised by a professional engineer experienced in this type of work.

If the piles encounter refusal before sufficiently penetrating into the recommended bearing zone, then pile capacities may need to be revisited and alternative measures sought. Therefore, pile driving records should be kept particularly, if refusal is met above the recommended bearing zone.

It should be noted that the pile tip elevation provided above is for initial guidance and estimating purposes only. Due to potentially variable soil conditions, the actual pile tip

elevation will vary. The contract should allow for some variation in pile lengths and this aspect should be taken into consideration when ordering the piles. The possibility of piles encountering potential cobbles and boulders or any other obstruction during angering or driving should be anticipated. In view of this, the tips of the piles should be stiffened to minimize damage to the piles while penetrating in recommended bearing zone. Care must be taken to avoid overdriving and damaging the pile tip (i.e., the structural capacity of the piles should not be exceeded). Stiffening of the tops of the piles may also be required.

During the driving process, piles that have already been driven will need to be monitored to assess if heaving occurred due to the effects of driving of adjacent piles. If this phenomenon occurs, the affected piles will need to be re-driven. Re-tapping, to check that relaxation has not occurred, will be necessary. Furthermore, it may be necessary to stagger the driving of the piles. The piles should be provided with reinforced tips, as per OPSD 3000.100.

The passive resistance and horizontal sub-grade coefficient of the soil (ks) are likely required to evaluate the lateral capacity of piles.

The soil parameters generally required to assess the passive earth pressure on the pile are presented in **Table 4.2**.

Soil	Passive Earth Pressure Coefficient, K <sub>P</sub>	Effective unit weight, □ <sup>□</sup> (kN/m³)
Well compacted 'Granular B' or equivalent Fill: adjacent to pile cap, extending at least 3 times its size vertically and laterally	3.3	12.0
Existing Fill (sandy or clayey), assuming angle of internal friction (22 degrees)	2.2	10.7
Native: very soft to stiff silty clay, assuming angle of internal friction 26 degrees	2.6	9.2
Native: compact Silt, assuming angle of internal friction (30 degrees)	3.0	10.2
Notes: i. To err on the conservative side, for the p table was assumed at the existing groun	oile analyses, the Id surface. The e	groundwater ffective or

 Table 4.2
 Soil Parameters for Ultimate Lateral Earth Resistance on Piles

	submerged unit weight must be used below the groundwater level for
	long term passive resistance.
ii.	The contribution of passive resistance within 1.1m below the finished
	grade (frost depth) must be ignored, unless it is approved by WSP.

The horizontal sub-grade coefficient of the soil  $(k_s)$  can be required to evaluate the lateral deflection of piles.

Where the soil is primarily cohesive, the undrained shear strength of the soil is given in Table 4.3.

In this case,

ks=67 cu/d	
Where	$k_s$ = coefficient of horizontal subgrade reaction $c_u$ = undrained shear strength d = pile width or diameter

In cohesionless soils, the coefficient of horizontal sub-grade reaction can be estimated from:

#### ks=nhz/d

Where	ks = coefficient of horizontal sub-grade reaction					
	z = depth					
	d = pile width					
	n <sub>h</sub> = coefficient related to soil density as given in Table 4.3					

Soil Type	Clayey Soil and Shale Bedrock, C <sub>u</sub> (kPa)	Granular Soils, n⊦ (kN/m³)
Well compacted 'Granular B' or equivalent Fill: adjacent to pile cap, extending at least 3 times its size vertically and laterally		4,400
Existing Fill (sandy or clayey)		1300
Native: very soft to stiff silty clay	12	
Native: compact Silt		4400

#### Table 4.3 Recommended Unfactored Soil Parameters for Calculation of ks

Note: The contribution of lateral resistance within 1.1 m below the finished grade (frost depth) must be ignored, unless it is approved by WSP.

The lateral resistance of the piles can be supplemented, if desired, by horizontal components of battered piles. In this instance, it is recommended that the batter be limited to no more than 4:1 as in practice greater batter may be difficult to install.

If the centre-to-centre distance between adjacent piles is less than three (3) times the pile size, group effect on the vertical bearing resistance should be considered. If the centre-to-centre distance between adjacent piles is equal to or greater than three (3) times the pile size, the group effect for the vertical bearing resistance can be ignored.

#### 4.6.2 Yard Piping

The anticipated behaviour of the soils as related to the support of the pipe and the stability of open cut excavations are summarized on **Table 4.4** and are also briefly discussed in the following sections.

Soil Type	Pipe Support	Stability During Construction in Open Excavation	Possible Means of Groundwater Control Below Groundwater Table	
Firm Fill and very soft to firm Silty clay	Not suitable	Stable at 1.5H:1V to 3H:1V	Pumping from filtered sumps established inside the base of trench	
Stiff to very stiff silty clay fill and native silty clay;	Satisfactory	Stable at 1.5H:1V to 1H:1V		
Compact sandy fill and native silt	Satisfactory if properly dewatered or stabilized	Stable at 1.5H:1V (unstable below water table for silt to sand)	Closely spaced well points/eductors for trenches	

Table 4.4 Soil Behaviour in Open Cut

#### 4.6.3 Excavation and Dewatering

Excavations of overburden can be carried out with heavy hydraulic backhoe. The stabilized groundwater table in the overburden in the WWTP area is anticipated to be lying at Elev. 169.8 to 172.3 m. As the majority of soils is cohesive based on borehole information, no major problems with groundwater are anticipated for the excavation of proposed yard piping. The groundwater seepage can be handled generally by pumping from filtered sumps in the bottom of the excavation. Increasing dewatering will be locally required when excavation reaches the saturated silt within the cohesive soils at a depth of 13.3m (or below) below the ground surface at the borehole location of BH20-08.

More comments regarding the type and extent of groundwater control required is provided in the WSP's report entitled "Preliminary Hydrogeological Investigation – South Niagara Falls WW Solutions EA, Niagara Region, ON", dated May 27, 2022.

The excavation for yard piping is expected through the fill followed by silty clay locally interbedded with silt layer. Possible large obstructions such as buried concrete / bricks are also anticipated in the fill material. Provisions must be made in the excavation contract for the removal of possible obstructions in the fill material.

All excavations must be carried out in accordance with the most recent Occupational Health and Safety Act (OHSA). In accordance with OHSA, the fill material can be classified as Type 3 Soil above the groundwater table. The firm to stiff cohesive deposit can be classified as Type 3 Soil above the groundwater table and Type 4 Soil below the groundwater table. The very soft to soft cohesive deposit classified as Type 4 soil.

#### 4.6.3.1 Trench Boxes

Where permissible under the OHSA and where its use is considered to be a safe alternative for shoring and bracing, contractors may decide to utilize trench boxes for temporary trench wall support for trenches less than 6 m deep in Type 2 and Type 3 Soils. Where trench depths exceed 6 m, Engineered Support Systems are required under the OHSA as defined in the Regulation. In such cases, the use of prefabricated support systems (trench boxes) is not permitted.

While the use of trench boxes is an effective and economical trench-support method, its use can cause increased loss of ground relative to properly braced shoring, especially when working close to granular base courses below the existing pavements or along existing utility trenches backfilled with granular materials. Trench boxes also reduce the contractor's ability to compact backfill materials placed between the trench wall and the outer trench box shell, thereby increasing the likelihood of post-construction settlements along the trench walls.

It is important that the trench not be over-excavated to ensure a tight fit between the box and the trench walls. Trench boxes need to be installed expediently. When moving the box, the void space between its outer walls and the trench must be backfilled and compacted. This may require raising the box sequentially prior to sliding it laterally.

When trench boxes are used along existing roadways, settlements frequently occur along the trench wall, which may manifest months after completion of backfilling. In such cases, following the backfilling of the trench, road reconstruction should include a provision for saw-cutting the asphalt at least 1.5 m back from the trench walls, recompacting the upper trench backfill, and then repaying.

All excavated spoils should be placed at least the depth of the trench away from the trench's edge to mitigate the risk of excavation instability.

It is recommended that the excavations for service trenches below the groundwater table be carried out in short sections using a suitable 'geofabric' below the bedding (fine migration prevention) and backfilling the trench section immediately after pipe placement.

#### 4.6.3.2 Pipe Support and Bedding

The borehole records indicate that shallow compact fill and stiff to very stiff silty clay are capable of providing adequate pipe support using the OPSD 802.031. The subgrade condition must be inspected and verified by geotechnical personnel. If very soft to firm clayey soil or fill (SPT 'N' value < 8) are present at the proposed pipe invert or trench invert elevation, the unsuitable soil should be sub-excavated and replaced using conventional Class "B" bedding. The replacement fill should be placed in loose lifts not exceeding 150 mm in thickness and then compacted to 100% of Standard Proctor Maximum Dry Density (SPMDD) at a placement water content of  $\pm 2\%$  of optimum. Each loose layer shall be compacted to 100% SPMDD prior to the placement of the next upper layer.

If the very soft to firm clayey soil (encountered at depths of 3.1 to 5.3 m below the existing ground surface in BH20-08, BH20-10, BH20-11, and BH20-12S) could not be removed, consideration should be given to use flexible pipe to allow big long-tern differential settlements. Consideration can be also given to soil improvement method (such as geopiers, soil/cement mixed columns) or deep foundation (such as helical piles) to support the yard piping.

The compacted granular base and the cover material for all pipes should consist of Granular "A" material in accordance to OPSS.MUNI 1010 for concrete pipes. Granular D (Limestone Screenings) is recommended for the bedding material of PVC pipes. All granular materials should be placed in maximum 200mm thickness. The granular bedding and cover materials should be compacted to 100% Standard Proctor Maximum Dry Density (SPMDD). Care should be exercised when compacting the cover material on top of the pipes to avoid damaging them. The use of light, hand operated compaction equipment is recommended in these areas.

#### 4.6.3.3 Backfilling

Based on visual and tactile examination, the on-site excavated granular fill and native cohesionless soils are considered to be suitable for re-use as backfill in the service trenches provided their moisture contents at the time of construction are at or near ( $\pm 2\%$ ) optimum.

The very soft to firm silty clay deposit is considered as not suitable for backfill due to its highwater content and compressibility.

The backfill should be placed in maximum 200 mm thick layers at or near ( $\pm 2\%$ ) their optimum moisture content and each layer should be compacted to at last 95% SPMDD. The degree of compaction should be increased to 100% within the top 2.0 m of the subgrade. Unsuitable materials such as organic soils, boulders, cobbles, frozen soils, etc. should not be used for backfilling. The existing road pavement structure should be reinstated. The granular pavement sub-base and base materials should be compacted to at least 100% of their respective

SPMDD. New granular material must match into the undersides of existing to ensure unimpeded cross drainage.

### 4.7 Issues and Data Gaps

The following issues and data gaps were identified in the geotechnical data with warrant further investigation:

- Large zones of insufficient geological and geotechnical data;
- Specific data at river, creek and road crossings;
- Precise definition of the transition from overburden to bedrock;
- Definition of the bedrock channels/valleys;
- Depth of fill material;
- Depth of highly weathered bedrock and/or bedrock surface;
- Strength of overburden and bedrock;
- Zone of very soft to firm silty clay;
- Definition of the qualities of cobbles and boulders;
- Presence of naturally occurring gases including Methane gas within the bedrock;
- Data on till and bedrock potential for abrasiveness during tunnelling;
- Groundwater table; and
- Soil and bedrock environmental quality

The recommendations for further geotechnical investigation are as follows:

- Additional boreholes with spacing of approximately 150m along the proposal alignment of trunk sewer;
- Additional boreholes with monitoring wells at both sides of watercourses;
- Additional boreholes with monitoring well at both sides of QWE and CN Rail;
- Additional boreholes within the footing of proposed structure and access road in the WWTP site;
- Additional boreholes with soil coring to determine the quantity of cobbles/boulders;
- Geophysical survey along the proposal alignment of trunk sewer to determine the bedrock surface;
- Laboratory tests including consolidation tests and triaxial tests on the soft soils;

- Laboratory tests including unconfined compression tests, triaxial compression tests, tensile tests, punch penetration tests, and CERCHAR abrasivity tests, and slake durability on the bedrock if tunneling in bedrock is selected; and
- Geotechnical baseline report (GBR) for tunnelling

## 5 General Comments and Limitations of Report

WSP should be retained for a general review of the final design and specifications to verify that this report has been properly interpreted and implemented. If not accorded the privilege of making this review, WSP will assume no responsibility for interpretation of the recommendations in the report.

The comments given in this report are intended only for the guidance of design engineers. The number of boreholes required to determine the localized underground conditions between boreholes affecting construction costs, techniques, sequencing, equipment, scheduling, etc., would be much greater than has been carried out for design purposes. Contractors bidding on or undertaking the works should, in this light, decide on their own investigations, as well as their own interpretations of the factual borehole and test pit results, so that they may draw their own conclusions as to how the subsurface conditions may affect them.

This report is intended solely for the Client named. The material in it reflects our best judgment in light of the information available to WSP at the time of preparation. Unless otherwise agreed in writing by WSP, it shall not be used to express or imply warranty as to the fitness of the property for a particular purpose. No portion of this report may be used as a separate entity, it is written to be read in its entirety.

The conclusions and recommendations given in this report are based on information determined at the test hole locations. The information contained herein in no way reflects on the environment aspects of the project, unless otherwise stated. Subsurface and groundwater conditions between and beyond the test holes may differ from those encountered at the test hole locations, and conditions may become apparent during construction, which could not be detected or anticipated at the time of the site investigation. The benchmark and elevations used in this report are primarily to establish relative elevation differences between the test hole locations and should not be used for other purposes, such as grading, excavating, planning, development, etc.

The design recommendations given in this report are applicable only to the project described in the text and then only if constructed substantially in accordance with the details stated in this report.

Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. WSP accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report. We accept no responsibility for any decisions made or actions taken as a result of this report unless we are specifically advised of and participate in such action, in which case our responsibility will be as agreed to at that time.

We trust that the information contained in this report is satisfactory. Should you have any questions, please do not hesitate to contact this office.

# Explanation of Terms Used in the Bedrock Core Log

# Strength (ISRM)

#### Grade Description Unconfined Term **Compressive Strength** (MPa) (psi) Extremely RO Indented by thumbnail 0.25-1.0 36-145 weak rock Very weak R1 Crumbles under firm 1.0-5.0 145-725 blows with point of geological hammer, can be peeled by a pocket knife Weak rock R2 Can be peeled by a pocket 5.0-25 725-3625 knife with difficulty, shallow indentations made by firm blow with point of geological hammer Cannot be scraped or peeled 25-50 Medium R3 3625-7250 Strong with a pocket knife, specimen can be fractured with single firm blow of geological hammer Strong rock R4 Specimen require more than 50-100 7250-14500 one blow of geological hammer to fracture it Very strong R5 Specimen requires many 100-250 14500-36250 blows of geological hammer rock to fracture it Extremely R6 Specimen can only be >250 >36250 strong rock chipped with geological hammer

# Bedding (Geological Society Eng. Group Working Party, 1970. Q.J. of Eng. Geol. Vol. 3)

Term	Bed Thickness	
Very thickly bedded	>2 m	>6.5 ft
Thickly bedded	600 mm-2 m	2.00-6.50 ft
Medium bedded	200 mm-600 mm	0.65-2.00 ft
Thinly bedded	60 mm-200 mm	0.20-0.65 ft
Very thinly bedded	20 mm-60 mm	0.06-0.20 ft
Laminated	6 mm-20 mm	0.02-0.06 ft
Thinly laminated	<6 mm	<0.02 ft

# TCR (Total Core Recovery)

Sum of lengths of rock core recovered from a core run, divided by the length of the core run and expressed as a percentage.

# SCR (Solid Core Rocovery)

Sum length of solid, full diameter drill core recovered expressed as a percentage of the total length of the core run.

# RQD (Rock Quality Designation, after Deere, 1968)

Sum of lengths of pieces of rock core measured along centreline of core equal to or greater than 100 mm from a core run, divided by the length of the core run and expressed as a percentage. Core fractured by drilling is considered intact. RQD normally quoted for N-size or H-size core.

<i>i</i> .	
RQD(%)	Rock Qualit
90-100	Excellent
75-90	Good
50-75	Fair
25-50	Poor
0-25	Very poor

# Weathering (ISRM)

<b>Term</b> Fresh	Grade W1	<b>Description</b> No visible sign of rock material weathering
Slightly weathered	W2	Discolouration indicates weathering of rock material and discontinuity surface. All the rock material may be discoloured by weathering and may be somewhat weaker than in its fresh condition
Moderatel weathered	y W3 I	Less than half of the rock material is decomposed and/or disintegrated to a soil. Fresh or discoloured rock is present either as a either as a continuous framework or as corestones
Highly weathered	W4	More than half of the rock material is decomposed and/or disintegrated to a soil. Fresh or discoloured rock is present either as a continuous framework or as corestones
Completely weathered	y W5 I	All rock material is decomposed and/or disintegrated to a soil. The original mass structure is still largely intact
Residual so	bil W6	All rock material is converted to soil. The mass structure and material fabric are destroyed. There is a large change in volume, but the soil has not been significantly transported
(E1) E	and the states.	

# (FI) Fracture Index

Expressed as the number of discontinuities per 300mm (1 ft). Excludes drill-induced fractures and fragmented zones. Reported as ">25" if frequency exceeds 25 fractures/0.3m.

### **Broken Zone**

Zone of full diameter core of very low RQD which may include some drillinduced fractures.

# **Fragmented Zone**

Zone where core is less than full diameter and RQD = 0.

# **Discontinuity Spacing (ISRM)**

Term	Average Spacing							
Extremely widely spaced	>6 m	>20.00 ft						
Very widely spaced	2 m-6 m	6.50-20.00 ft						
Widely spaced	600 mm-2 m	2.00-6.50 ft						
Moderately spaced	200 mm-600 mm	0.65-2.00 ft						
Closely spaced	60 mm-200 mm	0.20-0.65 ft						
Very closely spaced	20 mm-60 mm	0.06-0.20 ft						
Extremely closely spaced	<20 mm	>0.06 ft						
Note: Excludes drill-induced fractures and fragmented rock.								

### **Discontinuity Orientation**

Discontinuity, fracture and bedding plane orientations are cited as the acute angle measured with respect to the core axis. Fractures perpendicular to the core axis are at  $90^\circ$  and those parallel to the core axis are at 0°.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 19
