

Life Cycle of a Brookie

Brook Trout are very sensitive to their environment, and need cold, clear, unpolluted water to survive. Here in Niagara, we can find some Brook Trout in the Twelve Mile Creek.

If the conditions are right, the Brook Trout will spawn in the fall (between mid-September and November), and their population will increase. It can take upwards of 2 years for the Brookie to reach full maturity, and there are five (5) main stages to its' life cycle.
